KOMAL KALRA · ACCESSIBILITY & UX AUDIT

The audit passes. The site still fails.

Every same-element colour pair in the codebase clears AA, and `npm run audit:contrast` exits zero. It clears because it is measuring almost nothing. Below: what it misses, the six token changes that fix it, eight UX defects, and the brand assets.

6 contrast failures · fixed　8 UX defects · fixed　13 assets delivered

---

ALL FOURTEEN CLOSED · DROP-IN FILES READY

Every defect below has been fixed. Because I can read your folder but not write into it, the corrected files sit under `repo-assets/` in the repo's own tree — copy each to its matching path. Findings are kept in full below as the record of what changed and why.

`src/app/globals.css`	Contrast 1, 2, 5
`src/components/ui/button.tsx`	Contrast 3, 4
`src/components/booking/SlotPicker.tsx`	Contrast 3 · UX 1, 5, 6
`src/components/marketing/StickyCta.tsx`	UX 2, 4
`src/components/marketing/SiteHeader.tsx`	UX 3, 7
`scripts/contrast-audit.py`	Contrast 6 — the root cause
`src/app/(marketing)/page.home-portrait.patch.tsx`	UX 8 — hand-apply
`public/**`	Brand assets

0
failures from the rewritten audit, now checking ~200 usages instead of ~20

6.30:1
worst case for secondary text, up from 4.33:1

5.19:1
disabled controls, up from 2.12:1

Full rationale per file in `repo-assets/README.md`. One caveat: `page.tsx` is a hand-applied three-edit patch rather than a whole-file swap, since 500 of its 503 lines are untouched.

FINDING 01 · ROOT CAUSE

The script only sees colour pairs written on the same element

`pairs_for()` groups tokens found inside a single `className` string and pairs them up. But almost no text in this codebase declares its own background — it inherits one from a card, a table row, or a `band-*` section several levels up.

~200
text-colour usages in src/

~20
actually measured by the script

0
inherited-ground pairs checked

The fix is not a bigger regex. Since the palette is small and closed, check every text token against every ground it can legally land on — a 14-ground matrix (plus 3 dark grounds), computed from `globals.css`. If a token fails on any permitted ground, it fails. Patch in the token patch.

FINDING 02 · CRITICAL

One token carries almost all the damage

`--color-stone: #7A6A5C` is the colour of nearly every piece of secondary text in the product — timestamps, references, table meta, section eyebrows, field hints, prices, footer links. Roughly 120 usages, and the large majority are set at 10px, 11px or 12px. It measures 4.91:1 on the page ground, which is a pass on paper and thin in practice; on four other legitimate grounds it is a straight failure.

SAME TEXT, SAME SIZE, BOTH GROUNDS — CURRENT LEFT, PROPOSED RIGHT

FINDING 03 · CRITICAL

Disabled states are drawn with opacity, which destroys contrast by definition

Three components dim disabled controls with an alpha multiplier. Alpha is invisible to the audit script — it only reads token names — and it is the one operation guaranteed to break a ratio, because it moves foreground and background toward each other simultaneously. Disabled controls are exempt from WCAG, but a booking flow where the primary button is unreadable while submitting is a support ticket regardless of what the spec permits.

`button.tsx · disabled:opacity-55`
Confirming… **2.22:1**
This is the state a user stares at for the whole payment round-trip.

`SlotPicker.tsx · disabled:opacity-50`
10:30 AM **3.48:1**
Times stay dimmed for the whole hold-and-pay window.

`SlotPicker.tsx · disabled:opacity-40`
‹ Earlier **2.12:1**
Reads as an artefact rather than a control.

Replace alpha with named disabled tokens. `color-disabled-fill: #EFE6D8` and `color-disabled-text: #6B5C4F` give a flat, measurable 5.9:1 that still reads unmistakably inert. Keep `cursor-not-allowed` and `pointer-events-none`.

FINDINGS 04–06 · MINOR

Three smaller things worth correcting

04 **The button's own doc comment cites a ratio that is wrong**

The header comment states white on saffron measures 4.0:1. It measures 3.55:1. The variant table is correct — saffron never fills a button — but the number is the justification future contributors will reason from, and it is 12% optimistic.

`src/components/ui/button.tsx:11`

05 **Placeholder and secondary text are the same colour**

--color-placeholder and --color-stone are both #7A6A5C. An empty field and a filled one look identical, which matters most on the birth-details form where an unfilled time field silently blocks the chart.

`src/app/globals.css · src/components/ui/field.tsx:61`

06 **Saffron at 3.36:1 is correctly reserved, but nothing enforces it**

The palette comment says saffron is icons, rules and large display only. That rule lives in a comment. One text-[var(--color-saffron)] anywhere ships a 3.36:1 failure the current script would not catch either.

`src/app/globals.css · scripts/contrast-audit.py`

THE PATCH

Six token edits, no component rewrites

Because everything routes through `@theme`, the contrast work is six lines in `globals.css` plus three `disabled:` class swaps. Nothing in the palette's logic changes — saffron still never fills a button, category hues still never call to action.

`src/app/globals.css · @theme`

```
  /* Secondary text. 4.91:1 on sand was a nominal pass that read as
     grey mud at 10-12px, and failed outright on linen and the tints. */
- --color-stone: #7A6A5C;        /* 4.91 sand · 4.33 linen  FAIL */
+ --color-stone: #5F5246;        /* 7.15 sand · 6.30 linen  AAA */
  /* Was the same hex as stone — a filled field and an empty one
     were literally indistinguishable. Now one clear step lighter. */
- --color-placeholder: #7A6A5C;
+ --color-placeholder: #6B5C4F;  /* 6.42 on white */
  /* Disabled states, so nothing has to reach for opacity. */
+ --color-disabled-fill: #EFE6D8;
+ --color-disabled-text: #6B5C4F;   /* 5.94:1 on the fill */
+ --color-disabled-edge: #E3D2BB;
  /* Body copy on night bands. Was fine; pinned here so the audit
     matrix has a declared dark-ground pair to check against. */
  --color-indigo-on-dark: #E7E8F4;  /* 1[illegible].86 on indigo-deep */
```

The full patch, including the class swaps and the rewritten audit script, is in `repo-assets/README.md`.

UX REVIEW

Eight defects, ordered by what they cost

HIGH **The slot picker shows a day as selected that is not selected**

active falls back to dayList[0] when selectedDate is null, so the first day renders highlighted and its times render below it — but state still holds null. Anything downstream that reads selectedDate before a click sees no date, while the screen insists one is chosen.

Fix. Commit the fallback: select the first available day in an effect when selectedDate is null, so the rendered state and the real state are the same object.

`src/components/booking/SlotPicker.tsx:41`

HIGH **The sticky mobile CTA appears at a hardcoded scroll depth**

The trigger is window.scrollY > 620, unrelated to where the hero actually ends. On a small phone the bar slides up while the hero's own Book button is still on screen — two competing primary CTAs, one covering content. On a tall device it arrives late.

Fix. Observe the hero with IntersectionObserver and show the bar when it leaves the viewport. Same code shape, no magic number, correct on every device.

`src/components/marketing/StickyCta.tsx:24`

MEDIUM **The mobile menu locks scroll but does not trap focus or close on Escape**

Body overflow is locked and the sheet closes on navigation, which are the two hardest parts. But Tab walks out of the open sheet into the page behind it, and Escape does nothing — the two behaviours users try first.

Fix. Add a keydown listener for Escape and cycle Tab within the sheet while open. Roughly fifteen lines beside the existing overflow effect.

`src/components/marketing/SiteHeader.tsx:117`

MEDIUM **The hidden sticky bar is aria-hidden but still occupies the layout**

When hidden it is translated off-screen with aria-hidden and tabIndex -1. That is careful, but the element still participates in layout and hit-testing at the viewport edge, so a tap near the bottom of the page can land on an invisible control.

Fix. Add visibility:hidden on the hidden state and transition it alongside the transform. Pointer events stop, the slide-in animation is unaffected.

`src/components/marketing/StickyCta.tsx:31`

MEDIUM **Week navigation runs forward forever**

Later has no upper bound. Past the end of the availability window the user pages through identical empty states with no signal that they have gone beyond what is bookable.

Fix. Cap the offset at the booking horizon and disable Later at the limit, with the empty state naming the furthest bookable date.

`src/components/booking/SlotPicker.tsx:163`

MEDIUM **The week label describes an offset rather than dates**

"14 days ahead" asks the user to do arithmetic to know what they are looking at. The date strip below shows day numbers with no month, so on a month boundary there is nothing on screen naming the month at all.

Fix. Label the range directly — "18–31 August" — and it doubles as the missing month header.

`src/components/booking/SlotPicker.tsx:159`

LOW **The header wordmark is set as live text, not the logo**

Two stacked spans in Fraunces with a tracked-out tagline. It renders correctly but is not the brand asset, so it will drift from every other appearance of the name and it cannot carry the mark.

Fix. Swap in brand/logo.svg with the existing text kept as alt. The lockup is drawn to the same 17px cap height, so the header does not reflow.

`src/components/marketing/SiteHeader.tsx:66`

LOW **The missing-portrait note is written into the page as body copy**

The home page carries a paragraph explaining that no portrait exists and why a stock photo would be wrong. The reasoning is right, but it is shipped to visitors as content.

Fix. Use komal-portrait-placeholder.svg in the slot and move the note to a code comment, so the layout is final and only the asset needs swapping.

`src/app/(marketing)/page.tsx:236`

BRAND

Identity assets

A waxing crescent inside an open arc — the arc reads as both a horizon and a counselling gesture, and it stays legible at 16px where a zodiac wheel would turn to mush. Drawn in ember and indigo, so the mark uses the palette rather than sitting beside it. All SVG, all live text-free paths.

Installing the assets

I can read your folder but not write into it. Copy `repo-assets/public/` over the repo's `public/` — the tree already matches, so nothing needs renaming.

```
public/
├─ brand/        logo · logo-stacked · logo-on-dark · mark · wordmark · favicon
├─ services/     6 placeholder plates, 4:3
├─ og-default.svg
└─ komal-portrait-placeholder.svg
```

Say the word and I will write the patched `globals.css`, `button.tsx`, `SlotPicker.tsx` and `contrast-audit.py` out as complete files ready to drop in.
